1 **General information**

These assembly and operating instructions describe the door drive DCC-80 for the versions NHK, SK, ER, SK-WE, NHK-WE (hereinafter referred to as "DCC"). The instructions are intended for technicians that install and maintain the product, and for the operator using the product.

The illustrations in these assembly and operating instructions help you to better understand the descriptions and procedures. The illustrations only serve as examples and may deviate slightly from your product's actual appearance.

Explanation of symbols

Pictograms and signal words

Warning of electrical voltage!

This symbol indicates dangers to the life and health of persons due to electrical voltage when handling the system.

Crush hazard to the whole body!

This sign indicates hazardous situations with a crush hazard to the whole body.

Crush hazard to limbs

This sign indicates hazardous situations with a limb crush hazard.

Notice symbols

NOTICE NOTICE

... indicates important information (e.g. material damage), but does not indicate hazardous situations.

Information symbols

Info!

Information marked with this symbol helps you to carry out your tasks quickly and safely.

Refers to text and image

Refers to a graphic of the corresponding connection variant in the Figures chapter

Other symbols on the door drive

This symbol indicates that the door drive door drive is designed for a cycle sequence of 15 cycles per hour.

2 Safety

Observe the following safety information:

A WARNING Risk of injury when disregarding the safety information and instructions!

Failure to observe the safety information and instructions can cause electric shock, fire and / or severe injuries.

- Following the safety information and directives given in these assembly and operating instructions helps to avoid personal injuries and material damage while working on and with the product.
- Before starting work on the product, read the assembly and operating instructions, especially the Safety chapter and the respective safety information, completely and carefully. It is important for you to have understood what you have read.
- Keep all safety information and instructions for future reference.
- Only use genuine spare parts of the manufacturer. Wrong or faulty spare parts can cause damage, malfunctions or even a total failure of the product.
- Children shall not play with the appliance.
- Cleaning and user maintenance shall not be made by children without supervision.

Occupational safety

Following the safety information and directives given in these assembly and operating instructions helps to avoid personal injuries and material damage while working on and with the product. Failure to comply with the safety information and directives given in these assembly and operating instructions or with the accident prevention regulations and general safety regulations relevant to the field of application shall exempt the manufacturer or its representative from all liability and shall render any damage claims null and void.

Intended use

The DCC is designed exclusively for opening and closing springbalanced or weight-balanced industrial sectional doors. It may not be used for garage doors without spring-balancing or weight-balancing mechanisms. Never make any modifications or changes to the product that have not been expressly approved by the manufacturer.

Foreseeable misuse

Any use other than described in chapter Intended use is regarded as reasonably foreseeable misuse. This includes but is not limited to:

- Improper maintenance activities or improper servicing, especially by non-qualified persons.
- Adding or installing components and parts which do not comply with the intended use to or in the door or the door drive.
- Modifications and changes to the product without the express permission of the manufacturer.
- Using the product for garage doors without spring-balancing or weight-balancing mechanisms.
- Using the door with other door constructions apart from industrial sectional doors, e.g. on overhead or sliding doors.

Any damage or injury as a result of reasonably foreseeable misuse or of not following the assembly and operating instructions will render the manufacturer's liability null and void.

Personnel qualifications

The following persons are qualified to perform assembly work and to work on the mechanical system (troubleshooting & repair):

Skilled workers with relevant training, e.g. industrial mechanic

A skilled worker is a person who, due to his/her professional training, his knowledge and experience as well as due to his/her knowledge of the relevant regulations, is able to judge the work assigned to him/her as well as to identify possible hazards.

The following persons are qualified to perform electrical installation work and to work on the electrical system (troubleshooting, repair & deinstallation):

Qualified electricians

Skilled electricians must be able to read and understand electric circuit diagrams, to put electrical systems into service and to maintain them, to wire control cabinets, to install the control software, to ensure the functionality of electrical components and to identify possible hazards resulting from handling electrical and electronic systems.

The following persons are authorised to handle the product:

Operating personnel

Dangers which may be posed by the product and motor-driven door

The product has undergone a risk assessment. The product's design and construction, which are based on this risk assessment, correspond to the current state-of-the-art. The product is safe to operate when used as intended. Nevertheless, residual risks remain!

▲ DANGER

Hazardous voltage!

Fatal electric shock when touching live parts. Observe the following safety rules when working on the electrical system:

- Disconnect from the mains.
- Secure against inadvertent switch-on.
- Verify de-energised state.
- Before opening the control wait for 1 minute to release residual voltage in the capacitors.
 - Work on the electrical system may only be performed by skilled electricians or instructed persons working under the direction and supervision of a skilled electrician in accordance with the electrotechnical rules and directives.

Crush hazard and risk of being struck by the closing door!

Persons can be struck when the door is closed or collide with the door.

- The control device must be mounted within sight of the door and at a safe distance from moving parts.
- If the control device cannot be locked against unauthorised operation and if it is not a key switch, place the control device at a height of 1.5 m and make sure it is inaccessible to the public.

3 Product description

Model variants

The DCC is equipped with a control device (hereafter referred to as "IPD-E") for operation and programming. The current status of the door as well as the navigation of the programming is indicated via a LED light (red/blue). The IPD-E can be used for basic programming.

Alternatively, a control device with a two-digit 7-segment display (hereinafter referred to as "IPD-S") can be connected to the DCC. The IPD-S indicates the current status of the door and, during the programming process, the menu and setting value. With an IPD-S connected to the DCC, you can access an extended function menu in the programming mode. Furthermore, the IPD-S is equipped with additional inputs and outputs.

- 1 LED status/programming
- 2 Housing cover

- 3 DCC-80 NHK / DCC-80 NHK WE with emergency crank handle
- 4 DCC-80 SK / DCC-80 SK-WE Emergency operation via quick chain
- 5 DCC-80 ER mechanical emergency release of the drive

Control devices

- 6 7-segment display (IPD-S only) Status/programming
- 7 OPEN button
- 8 STOP button
- 9 PROG button (IPD-S only)
- 10 CLOSE button
- 11 Key switch (variants IPD-E KS / IPD-S KS only)

Overview connection terminals

- LED LED red/blue for operation/programming
- PROG PROG button, activates programming mode
- J1 Connection of external control device / control device IPD-E/IPD-E KS
- J2 Input for photoelectric sensor
- J3 Input for door connection box
- J4 Input for roll-up protection mechanism
- J5 Slot for radio module (ISM 433/868)
- J6 Slot for service/extension module
- J7 TM-BUS connection (control device IPD-S / IPD-S KS, EDL100)
- J8 Battery serial interface
- J9 BTD-K slot (Bluetooth dongle)
- J10 Slot for extension module (prioritised input, interlock, output status relay 2)
- J11 Programming interface
- J12 Output status relay 1 (potential-free contact)
- J13 Connection of supply voltage via battery
- J14 Output. 24 V DC/750 mA
- J15 Motor connection
- X1 Antenna
- X2 Connection of functional earth 📥
- F1 Fuse 5 x 20 3.15AT

The rating plate is located at the side on the control housing. Observe the power supply specifications.

4 Assembly and installation

4.1 Preparing for installation

Safety information for installation and assembly

- Installation work may only be carried out by qualified technicians.
- Read these installation instructions before you start installing the product.

Scope of delivery

NOTICE

Check the supplied screws and wall plugs to make sure that they are suitable for the structural condition on the installation site.

The scope of delivery is determined by the product configuration. This usually consists of the DCC-80 door drive, a control device and the assembly material.

The assembly material contains the following components:

- 1 x mounting bracket (Alpha S bracket) incl. 2 fastening sets (screws + nuts)
- 4 x hexagon bolts M8 x 20 (DIN EN ISO 4017, article no. 050436-01-3-30)
- 4 x spring washers A8 (DIN 127 8.4)
- 4 x washers (DIN 9021 A8.4)
- 1 x key solid shaft
- 1 x key hollow shaft

Required tools

For the assembly of the DCC, the following tools are required: • Cross-tip screwdriver Phillips, size 2

- SW13 wrench
- slotted screwdriver, 2 mm

4.2 Opening and closing the housing cover

The housing cover has to be opened and closed in order to carry out the assembly. To do so, please proceed as follows.

Fig. Loosen the 6 screws on the housing cover and carefully pull the cover straight off towards the front. The housing cover is secured against falling off with a cord and can be left hanging from it. Adjust the housing cover so that it hangs down from the housing.

Fig. D Carefully put the housing cover on. Ensure that you insert the light guide, which is fixed inside the housing cover, through the guide in the non-contact safety device of the electronic components. On the sides, there are centring areas inside the cover which slide into the guides provided for this purpose when the cover is placed on the housing. This provides for the cover to close properly and ensures the sealing function. In the end, screw the housing cover to the housing using the 6 screws.

4.3 Mounting the door drive

Follow the instructions as well as the illustrations in the "Figures" chapter.

NOTICE

Before installing the drive, check whether the mechanical condition of the gate is running smoothly and whether the door is counterbal-anced.

Types of assembly

The DCC can be mounted with a mounting bracket or, alternatively, using the Universal torque support. During the assembly, observe the two applicable installation positions (fig. a) installation position 1 (vertical) and installation position 2 (horizontal, control unit upside down)).

Assembly with mounting bracket

Fig. Screw the mounting bracket on the gearbox side facing the door into the holes provided by using two M8 x 20 screws, spring washers and washers. Observe the tightening torque of 15 Nm.

Grease the door shaft's areas that are in contact with the rails.

Fig. C Remove one of the two screws on the key and insert the key into the groove of the door shaft. The side without the screw must face the end of the door shaft.

Fig. Push the drive onto the door shaft in the desired installation position and align the gear shaft with the groove on the door shaft. Push the drive onto the door shaft until the mounting bracket is supported on the door bracket.

Fig. Align the key and fix the position by screwing the second screw back in. Screw the mounting bracket to the door bracket. To do so, use the screw set supplied with the mounting bracket.

Assembly with Universal torque support

A suitable and load-bearing substrate (e.g. a wall) is required for the <u>ass</u>embly with the torque support.

Fig. Align the torque support with the door shaft and fasten the door shaft to the wall. Use the supplied wall plugs and screws to fix the unit to the wall.

Fig. 9 Push the door drive onto the door shaft as explained for installation with mounting bracket (fig. c to e). Connect the door drive to the torque support with 4 screws (M8 x 20) and washers.

4.4 Electrical installation

NOTICE

Malfunction due to defective insulation of the cables

- When connecting the cables, ensure that the cable sheath is stripped close to the connection terminal so that the cables remains insulated from each other.
- Avoid stowing cables in the connection compartment if they are too long. Shorten the cables if they are too long.

1. Using additional cable glands

If further cable feed-throughs are required for the installation, you can open them as follows:

Fig. To open a cable gland for an M16 cable gland, place a suitable slotted screwdriver in the circumferential joint (predetermined breaking point) at various points. Break out the material by gently hammering on the screwdriver. Loosen the cable gland attachment and place it on the cable to be fed through. Push the cable of the required length through the cable gland and secure the cable by tightening the attachment on the cable gland.

Fig. D Push the supplied cable glands through the corresponding openings and secure them with the corresponding nuts.

Fig. C If the M20 push-in fitting is to be used, carefully break out the are marked in the illustration (e.g. by using pliers).

Fig. Put on the push-in gland and guide the cable through it.

2. Mains connection

NOTICE Checking the mains connection

- Ensure that on-site fusing of 10 A is available.
- Check whether the mains connection on site complies with the pre-wired mains connection of the door drive (10 A CARA plug).
- Only use all-current sensitive residual current circuit breakers of type B for on-site fusing.

The DCC is wired in a ready-to-connect fashion using a cable and mains plug (10 A CARA plug) according to fig. a. In doing this, ensure that the supply disconnection is easily accessible after the installation.

3. Input J1 – External control device

G Crush hazard and risk of being struck by the closing door!

Please note that when using a control device for dead man/emergency operation, the movements of the door must be monitored. Otherwise,

- people can be crushed or hit by the garage door.
 The control device must be mounted within sight of the door and at a safe distance from moving parts.
- If the control device cannot be locked against unauthorised operation and if it is not a key switch, place the control device at a height of 1.5 m and make sure it is inaccessible to the public.

Connect external control devices and pulse generators to connection terminal J1. Connect a bridge between connection terminal J1.3/ $\underline{4}$ if no STOP button is used.

Fig. a Connection for control device with OPEN, STOP and CLOSE

Fig. b Connection of pulse generator OPEN, CLOSE

Fig. C Connection of pulse generator with pulse sequence OPEN-STOP-CLOSE-STOP-...

Fig. Connection of ceiling pull switch with pulse sequence OPEN-STOP-CLOSE-STOP-...

4. Input J2 – Photoelectric sensor

NOTICE

Malfunction due to incorrect photoelectric sensor type

For failure-free operation, only use photoelectric sensors with "light switching" mode.

Connect a photoelectric sensor to input J2 according to the following variants:

Fig. a Connection of 2-wire photoelectric sensor LS2

Fig. **b** Connection of 4-wire photoelectric sensor with testing

Fig. Connection of reflective photoelectric sensors

Then select the corresponding photoelectric sensor under menu item 36"Selection of photoelectric sensor J2".

5. Input J3 for door connection box

Crush hazard and risk of being struck by the closing door

A pressure wave switch as closing edge safety device may only be actuated after having been tested.

For this purpose, select the value 4 in menu item 35.

Fig. The door connection box allows for the connection of a safety edge, a wicket door contact and slack rope switches. The wicket door contact and the slack rope switches are electrically connected in series and are monitored by the door drive. Connect a door connection box to connection terminal J3.

If a wicket door is available, you have to connect a wicket door contact (model ENS-68xx) to one of the two door connection boxes. To do so, remove the 2 kOhm resistor on the respective door connection box and replace it with a wicket door contact (model ENS-68xx). Model ENS-68xx is tested in compliance with PL C as per EN 13849-1 and is monitored by the door drive.

Please note that switches with forced actuation complying with the specifications of EN 60947-5-1, Annex K, are to be used as slack rope switches. The supply line of the door connection box must to be laid at the door leaf, well protected against damage.

6. Input J4 –Roll-up protection mechanism

The input J4 offers the possibility of operating two roll-up protection mechanisms with OSE signal output (e.g. Fraba Vitector: Raytector, Witt TWIN-PRO). According to fig. a, connect a closing edge safety device and select the corresponding in menu item 38.

7. Slot J5 – Receiver module (optional accessory)

Fig. The use of a hand-held transmitter, attach the receiver module (ISM 433/868) to into slot J5 and connect the antenna to connection terminal X1. In order to program the hand-held transmitters, follow the instructions provided in "Programming the hand-held transmitter" in the Programming with IPD-E and Programming with IPD-S chapter.

8. Slot J9 – BTD K (optional accessory)

The BTD-K (Bluetooth dongle) allows for configuration of the DCC using an APP via Bluetooth.

Fig. Plug the BTD-K (Bluetooth dongle) into slot J9. The BTD-K is automatically detected.

9. Slot J10 – Option module (optional accessory)

Fig. Plug the option module into slot J10.

Fig. **b** The option module additionally offers the following connection options:

- Connection terminal J30 prioritised input, moves the door to a previously defined door position when activated. Further information is described in the Operation chapter.
- Terminal J32 output status relay 2 and terminal J31 input, enable coupling with another control unit (e.g. dock leveller control) to allow for mutual interlocking.

5 Initial operation

Crush and impact hazard at the garage door!

During the learning cycle, the drive automatically learns the normal mechanical force required to open and close the garage door. Force limits are deactivated until the conclusion of the learning cycle. The door movement will not be stopped by an obstruction!

For the entire path of motion, keep the door clear of persons and objects!

NOTICE	Checking the door before initial commissioning					
	•	Before	initial	set-up,	ensure	that

- Before initial set-up, ensure that the door can be moved smoothly.
- Remove any manual door locking mechanisms that can interfere with or block the door movement.
- Connect safety switches (slack rope switches) to monitor the ropes.
- Ensure that the door is spring balanced.

NOTICE

Do not interrupt the learning cycle

The learning cycle must not be interrupted, so that no incorrect position is recorded. Do not interrupt the learning cycle.

When the drive is switched on for the first time or after resetting to default settings, the installation wizard is started. The installation wizard guides you step by step through the initial installation. The following steps are carried out.

1. Selection of the door profile

Select a door profile according to the installed door by pressing the O or O button (in sequence fast/medium/slow):

- 1–3 standard fittings (cylindrical drum)
- 4-6 raised fittings (semi-conical drum)

7-9 vertical runner (conical drum)

Example 7 = vertical runner, fast

DCC display: the flashing number indicates the current door profile.

IPD-S indication: The 7-segment display indicates the current door profile. Confirm the setting by pressing and holding the O button.

2. Approaching and confirming the door OPEN end position

DCC indication: fast flashing of the red LED

IPD-S indication:

Move the door into the desired door OPEN position. Pressing the O or O button will move the door into the desired direction. The drive must be operated at least a half-turn without interruption. Once the desired position is reached, confirm it by pressing and holding the O button.

The rotation direction can be changed by simultaneously pressing the O, O and O button for 3 seconds.

3. Approaching and confirming the door CLOSE end position

DCC indication: slow flashing of the red LED

IPD-S indication:

Move the door into the desired door CLOSE position. Pressing the O or O button will move the door into the desired direction. Once the desired position is reached, confirm it by pressing and holding the O button. A minimum distance of approx. 1 m must be covered between the OPEN and CLOSE positions.

4. Carrying out a learning cycle

DCC indication: red LED permanently switched on

IPD-S indication:

When briefly pressing the O or O button, the door performs a force learning cycle by opening and closing.

After completion of the learning cycle, the initial set-up is complete. If further safety sensors are connected to the DCC, continue with step 5, otherwise with step 6.

5. Selection of alternative safety sensors

If an additional closing edge safety device or a photoelectric sensor is connected, configure it in the menu items "Select closing edge safety device J3" and "Select photoelectric sensor J2".

6. Test run

NOTICE

Compliance with standard EN 12453 Check the switch-off position of the door after

every setting you have carried out. The switch-off setting must correspond to a maximum distance from the ground of 50 mm, otherwise compliance with the standard EN 12453 is not ensured.

When programming and the force learning cycle have been completed, carry out a test run by checking all operating and safety functions. Once the test run and force measurement processes have been successfully completed in accordance with EN 12453, the door system is ready for operation.

6 Programming with IPD-E

6.1 Basic programming procedure

The DCC door drive without IPD-S is programmed via the PROG button of the door drive. Open the housing cover by loosening the six screws on the housing cover. The housing cover is secured against falling off with a cord and can be left hanging from it.

The DCC offers an LED-controlled basic settings menu. Proceed as follows to carry out programming settings:

- 1. To activate the configuration menu, press and hold the PROG button (2) until the LED (1) on the DCC changes from blue to flashing red.
 - ⇒ The configuration menu is activated and the red LED indicates which menu item is currently active by flashing periodically. After 60 seconds of inactivity, the configuration menu is automatically closed.
- Confirm the selected menu item by briefly pressing the button (STOP).
 - ⇒ The number of times the blue LED (1) is periodically flashing indicates the currently selected parameter.
- 4. Navigate to the desired parameter using the and button.
- 5. Confirm the selection with the
 button to accept the setting parameter and return to the configuration menu.
- Confirm the selection with the button
 to exit the programming.

6.2 Basic programming

Setting the door end positions (menu item 1)

Crush hazard and risk of being struck by the closing door

Ensure that no closing edge or photoelectric sensor monitoring is active whilst the end positions are set.

The door end positions OPEN and CLOSE must be set directly in succession.

- 1. Activate the configuration menu. The red LED indicates menu item 1 "Setting the door end positions".
- 2. Briefly actuate the 🖲 button. The red LED flashes continuously.
- 3. In order to define the door end position OPEN, keep the € button pressed until the door is completely open.
 - ⇒ If the door moves in the wrong direction, a reversal of the direction must be implemented. Press and hold the button combination (), () and () for 5 seconds until the red LED goes out briefly and then repeat step 2.

- Confirm the set position by pressing the

 button for a long time. After confirming the door end position OPEN, the red LED flashes slowly.
- 5. Move to the door end position OPEN and confirm the desired position by pressing the button. After confirming the door end position CLOSE, the configuration menu is exited automatically.
 - ⇒ The red LED is illuminated. The drive is in current learning mode.
- 6. Carry out a complete, failure-free opening and closing cycle.

Programming the hand-held transmitter (menu item 2)

You are provided with the possibility of programming 40 "KeeLoq" hand-held transmitter channels.

- 1. Navigate to menu item 2 "Programming the hand-held transmitter".
- 2. Briefly actuate the button. The LED flashes blue. The programming mode is activated for 30 seconds.
- 3. Actuate the button of the hand-held transmitter that is to be programmed.
 - ⇒ The blue LED flashes fast to indicate that the hand-held transmitter has been successfully taught.
- 5. Press the 🖲 button.

Deleting hand-held transmitters (menu item 2) 5 seconds 🖲

To delete all programmed hand-held transmitters, please proceed as follows:

- Activate the configuration menu and use the

 button to navigate to menu item 2 "Programming the hand-held transmitter".
- 2. Press and hold the O button for 5 seconds.
 - ⇒ The successful deletion of the hand-held transmitter is confirmed by the blue LED flashing quickly.

Programming the hand-held transmitter to 1/2 door opening (menu item 3)

- 2. Briefly actuate the button. The LED now flashes blue. The programming mode is activated for 30 seconds.
- 3. Actuate the button of the hand-held transmitter that is to be programmed.
 - ➡ The blue LED flashes fast to indicate that the hand-held transmitter has been successfully taught.
- 4. To program any additional hand-held transmitters, repeat the procedure from menu item 2 or exit the configuration by briefly pressing the ^O button until the red LED flashes quickly.
- 5. Press the 🖲 button.

Force setting opening (menu item 4)

- 1. Activate the configuration menu and use the € button to navigate to menu item 4 "Force setting opening".
- 2. Briefly actuate the
 button. The LED flashes blue. The number of times the LED flashes indicates the currently selected parameter.
- 3. Select the desired parameter with the $\textcircled{\bullet}$ or O buttons.
- 4. Confirm the selected parameter by briefly pressing the <a>left button.
 - ⇒ You then return to the selection menu via menu item 4 (LED flashes red 4 times).

Force setting closing (menu item 5)

Navigate to menu item 5. For fine adjustment of the closing force monitoring, please proceed as described in menu item 4.

Selection of closing edge safety device (menu item 6)

- Activate the configuration menu and use the button to navigate to menu item 6 "Selection of closing edge safety device".
- 2. Briefly actuate the
 button. The LED flashes blue. The number of times the LED flashes indicates the currently selected parameter.
- 3. Select the desired parameter with the \odot or \bigcirc buttons.
- 4. Confirm the selected parameter by briefly pressing the button.
 - ⇒ You then return to the selection menu via menu item 6 (LED flashes red 6 times).

Automatic selection of closing edge safety device (menu item 6) 5 seconds •

- Activate the configuration menu and use the button to navigate to menu item 6 "Selection of closing edge safety device".
- 2. Press and hold the ^(e) button for 5 seconds.
- 3. The automatic identification is started. The LED flashes blue. The number of times the LED flashes indicates the determined parameter.
- 4. Confirm the selected parameter by briefly pressing the button.
 - ⇒ You then return to the selection menu via menu item 6 (LED flashes red 6 times).

Selection of the photoelectric sensor (menu item 7)

You can select and activate a connected photoelectric sensor in this menu item. An auto detection can be started as with menu item 6 by pressing the \bigcirc button for a long time (press for 5 seconds).

Selection of the roll-up protection mechanism (menu item 8)

You can select and activate a connected roll-up protection mechanism in this menu item. An auto detection can be started as with menu item 6 by pressing the \bigcirc button for a long time (press for 5 seconds).

Selection of the door profile (menu item 9)

Select the door profile in this menu item. Three different closing speeds are available for each door profile.

Default settings (menu item 10, the red LED flashes quickly and continuously)

You can reset the drive to the default settings in this menu item. To do so, press and hold the
button for least 5 seconds. The setup wizard is then started automatically.

7 Programming with IPD-S

7.1 Programming procedure

The control device IPD-S is equipped with a PROG (2) button. This PROG (2) button is protected inside the control device. It can be operated via a small opening in the housing.

- To enter the programming mode of the DCC, press and hold the PROG (2) button of the IPD-S until the 7-segment display (1) indicates – –.
- 2. Press the button (HALT) to confirm the activation.
- Confirm the selection with the button ●. The 7-segment display (1) in the first digit now shows the menu which you are in. The second digit shows the current menu item in this menu.
- Confirm the selection with the button ●. The currently set value for the respective menu item flashes on the 7-segment display (1).
- Confirm the selection with the button
 The 7-segment display (1) confirms the entry by 5-time blinking of the decimal point and by returning the the menu item selection.
- If you want to complete the programming, press the button [●] repeatedly until - appears on the 7-segment display (1).
- Confirm the selection with the button
 to exit the programming.

Graphical representation of the programming process with the IPD-S

7.2 Programming with IPD-S

Menu 3 basic settings and initial operation

Setting the door end positions (menu item 30)

Crush hazard and risk of being struck by the closing door

Ensure that no closing edge or photoelectric sensor monitoring is active whilst the end positions are set.

The door end positions OPEN and CLOSE must be set directly in succession.

- 1. Select menu 3 "Basic settings" in the control, then select menu item 30 "Setting the door end positions".
- 2. Briefly press the PROG button so that flashes on the 7-segment display.
- - If the door moves in the wrong direction, a reversal of the direction must be implemented. Press and hold the button combination ● + ● + ● for 5 seconds. The successful change of the direction of rotation is confirmed by an animation on the 7-segment display. Then repeat step 2.
- Confirm the set position by pressing the button for a long time.
- After confirming the door end position OPEN, III flashes on the 7-segment display to program the door end position CLOSE. Press and hold the O button until the door is completely closed and confirm the set position by pressing and holding the O button.
- 6. After confirming the door end position CLOSE, the settings menu is exited automatically.
- 7. The 7-segment display now shows the **bin** symbol and the drive is in current learning mode. A complete, failure-free opening and closing run must be carried out in each case.

Setting the 1/2 door opening (menu item 32)

To set the position for a 1/2 door opening, proceed as follows:

- 1. In menu 3 "Basic settings", select menu item 32 "Door setting 1/2 opening".
- 2. Briefly press the PROG button so that the number 32 flashes on the 7-segment display.
- 3. Move the door to the desired position using the € and © buttons.
- 4. Confirm the set position by pressing the
 button for a long time.
 - ⇒ The decimal point flashes 5 times to indicate that the position has been taken over.

Selection of closing edge safety device (menu item 35)

- 1. Navigate to menu item 35 "Selection of closing edge safety device".
- 2. You can make an auto detection or a manual selection.
 - Auto detection: Keep the button pressed for 5 seconds. The setting for the closing edge safety device detected by the DCC appears. Briefly press the ● button to accept the indicated configuration or select another configuration using the ● and ● buttons.
 - ⇒ Without auto detection: Use the And buttons to select the desired configuration and briefly press the button to accept the indicated configuration and complete the setting.

Selection of the photoelectric sensor (menu item 36)

- 1. Navigate to menu item 36 "Selection of the photoelectric sensor".
- 2. You can make an auto detection or a manual selection.
 - Auto detection: Keep the button pressed for 5 seconds. The setting for the photoelectric sensor detected by the DCC appears. Briefly press the ● button to accept the indicated configuration or select another configuration using the • and ● buttons.
 - ⇒ Without auto detection: Use the and buttons to select the desired configuration and briefly press the button to accept the indicated configuration and complete the setting.

If you have selected the configuration "Photoelectric sensor mounted in the frame", a position learning cycle is carried out

after the menu is closed.

Selection of the pre-limit switch position (menu item 37)

NOTICE

Compliance with standard EN 12453

Check the switch-off position of the door after every setting you have carried out. The switch-off setting must correspond to a maximum distance from the ground of 50 mm, otherwise compliance with the standard EN 12453 is not ensured. This might result in the loss of certification.

- 1. Navigate to menu item 37 "Selection of the of the pre-limit switch position".
- 2. Briefly press the **()** button to indicate the currently set configuration.
- Set the switch-off position so that a maximum distance of 50 mm to the ground contact is generated. Values between 0 and 10 are provided to you for this purpose. Values of 4 (default setting) to 0 correspond to -10 mm to approx. -50 mm. Values from 5 to 10 correspond to 0 mm to approx. +50 mm.
- 4. Briefly press the button to accept the indicated configuration and complete the setting.

Selection of the roll-up protection mechanism (menu item 38)

- 1. Navigate to menu item 38 "Roll-up protection mechanism".
- 2. You can make an auto detection or a manual selection.
 - Auto detection: Keep the button pressed for 5 seconds. The setting for the roll-up protection mechanism detected by the DCC appears. Briefly press the ● button to accept the indicated configuration or select another configuration using the ● and ● buttons.
 - ⇒ Without auto detection: Use the and buttons to select the desired configuration and briefly press the button to accept the indicated configuration and complete the setting.

Menu 4 Further door settings

Unpairing of RSE-T and RSE-R

Selection of the warning time (menu item 43)

You have the option of setting different warning times for the opening and/or closing process. If the status relay is to be active during the warning time, you must also set the value 3 in menu item 45 (selection of the function status relay 1).

Selection of open time and automatic return (menu item 44)

You can set the desired open time in this menu item. After the open time has elapsed, the door automatically starts to close (automatic return). If no photoelectric sensor is selected in menu item 36 (value 1), value 4 is automatically set as the photoelectric sensor type in menu item 36 after selecting an open time. In order to use the automatic return function, the installation of a photoelectric sensor is required according to EN 12453.

Selection of the function status relay 1 and 2 (menu items 45/46)

The DCC provides a status relay whose function can be selected in menu item 45. A second, optional status relay can be plugged into slot J10 (option module). Then select the function in menu item 46 "Selection of the function status relay 2".

Menu 5 optional accessories

Wireless closing edge RSE (menu items 53,55,56)

NOTICE

After setting and before initial commissioning, check whether the safety devices are operating correctly.

The RSE system serves as a radio transmission system of the signals from the closing edge safety device, slack rope switch and wicket door sensor to the drive. The system is in accordance with PLc in compliance with EN 13849-1.

Please proceed as follows to commission the RSE system:

- 1. Connect the module to the DCC at slot J6.
- Select value 3 "RadioSafetyEgde system" in menu item 53 "Selection of plug-in module at slot J6".
- Select the type of the closing edge safety device in menu item "55". "Optical closing edge safety device OSE" (value 1) is preselected as a default value.
- 4. Select the type of the wicket door in menu item 58. "EN-S68xx" (value 1) is preselected as a default value.

Pairing of RSE-T and RSE-R

- 1. Navigate to menu item 55.
- 2. Keep the 🖲 button pressed for 5 seconds.
 - ⇒ The RSE-R emits a long beep sound for confirmation.
 - \Rightarrow Value 55 flashes on the 7-segment display (1).
- 3. Now press the button on the RSE-T.
 - \Rightarrow The RSE-R emits a long beep sound for confirmation.
 - ⇒ The drive confirms pairing by the decimal point flashing for 5 times in the LED display.

Impact and crush hazard due to the door movement!

By unpairing the RSE-T and RSE-R, the safety sensors are inoperative.

- Perform pairing of RSE-T and RSE-R again.
 Make sure that the RSE system is replaced by a coiled cable.
- 1. Navigate to menu item 56.
- 2. Keep the O button pressed for 5 seconds.
 - \Rightarrow The RSE-R emits several rapid beep sounds.
 - ⇒ The drive confirms unpairing by the decimal point flashing for 5 times in the LED display.

Menu 6 Radio settings

You are provided with the possibility of programming 40 "KeeLoq" hand-held transmitter channels. Please observe that every hand-held transmitter must be programmed individually.

Programming the start button on the hand-held transmitter (menu item 60)

- 1. Navigate to menu item 60 "Programming the start button on the hand-held transmitter".
- While the value "60" is flashing on the 7-segment display (1), press the button of the hand-held transmitter you want to program.
 - ⇒ Successful programming of the hand-held transmitter is indicated by the decimal point flashing 5 times.

Programming the button 1/2 door opening on the hand-held transmitter (menu item 61)

- 1. Navigate to menu item 61 "Programming the hand-held transmitter to 1/2 door opening".
- Actuate the button of the hand-held transmitter for 1/2 door opening.
 - ⇒ Successful programming of the hand-held transmitter is indicated by the decimal point flashing 5 times.

After programming the OPEN and CLOSED door end positions, the 1/2 door opening is automatically calculated and is immediately available. If a different position is desired, set it in menu item 32. This function is only possible in the pulse OPEN / pulse CLOSE operating mode.

Deleting all radio codes (menu item 63)

To delete all codes programmed, proceed as follows:

- 1. Select menu item 63 "Delete all radio codes".
- Press and hold the O button for 5 seconds.
- Successful deleting the hand-held transmitters is indicated by the decimal point flashing 5 times.

Menu 8 profile settings

Selection of the door profile (menu item 80)

In this menu item, the door profile that has been selected during the initial installation can be changed subsequently.

- 1. Navigate to menu item 80 and briefly press the 🖲 button.
- 2. Select the appropriate door profile 1-9 (standard fittings 1-3, raised fittings 4-6, vertical runner 7-9).
- 3. Confirm the profile selection by pressing the STOP button.
 - Changing the door profile requires a new failure-free force learning cycle in both the opening and closing direction and after exiting the menu. This will be indicated via the display and the LED on the drive.

Force setting opening (menu item 81)

NOTICE

Compliance with standard EN 12453

Any change of the force setting requires a subsequent check of the closing forces according to EN 12453.

The force detection for the opening direction can be adjusted in this menu item. The smaller the set value (1-10), the more sensitively the drive will react to external influences on the door.

- 1. Navigate to menu item 81 and briefly press the 🖲 button.
- Select the desired force setting (1 "very sensitive" to 10 "insensitive")
- 3. Confirm the selection with the button **•**. A new force learning cycle is not required when changing the force setting.

Information: If necessary, a new force learning cycle can be initiated by pressing and holding the STOP button on menu item 81

Force setting closing (menu item 82)

The force detection for the opening direction can be adjusted in this menu item. The smaller the set value (1-10), the more sensitively the drive will react to external influences on the door.

- 1. Navigate to menu item 82 and briefly press the ^(e) button.
- Select the desired force setting (1 "very sensitive" to 10 "insensitive")
- 3. Confirm the selection with the **O** button. A new force learning cycle is not required when changing the force setting.

If necessary, you can initiate a new force learning cycle by pressing and holding the **()** button in menu item 81.

Menu 9 Service

Limitation of maintenance cycles (menu item 90)

Select a number of cycles upon the completion of which the service indication is activated on the control. You can reset the maintenance counters by selecting the number of cycles in the respective menu item again.

Overall cycle counter output door (menu item 91)

By pressing the STOP button, the cycle counter outputs the values digit by digit starting with the highest decimal power. The counter cannot be reset.

Output of firmware version, SN, production date (menu item 98)

Pressing the STOP button starts the sequential output of the control information. "1.00 – 01.01.2023 – 123456789" means Firmware version "R1.00", production date "01.01.2023", serial number "123456789".

Resetting to default setting (menu item 99)

Keep the STOP button pressed to open the default settings. The drive starts automatically with the setup wizard.

8 Operation

Safety instructions for operation

Observe the following safety information for operation:

Check the DCC and the door system connected for visual defects before use. If the operational behaviour of the door system changes, switch the system off immediately. Recommissioning must be prevented. Notify the operating company of the change.

- The operator must be instructed on how to handle the DCC or the motor-driven door system and be familiar with the applicable safety regulations.
- Comply with the local accident prevention regulations relevant to the field of application.
- Check the DCC and the door system connected for visual defects before use.
- If you detect any safety-relevant deficiencies, decommission the door system and report all defects to the responsible line manager.
- · Have the deficiencies remedied immediately.

Dead man OPEN / CLOSE

See emergency operation.

Pulse OPEN / pulse CLOSE

If you press the $\textcircled{\bullet}$ button briefly, the door starts moving in the opening direction until the door reaches the OPEN door end position, or until the door is stopped by actuating the $\textcircled{\bullet}$ button. If you press the $\textcircled{\bullet}$ button briefly, the door starts moving in the CLOSE direction until the door end position CLOSE is reached.

This operating mode requires protection level "C" according to EN 12453. This protective device is part of the DCC as an integrated current control/force monitoring function. If the required closing forces cannot be maintained, a closing edge safety device can be connected. When the force detection or closing edge safety device is activated while the door is closing, the door will stop and reversal of the direction will be activated. Activation of the closing edge safety device has no effect when the door is opening. In the event of a defect of the closing edge safety device, the door can be closed in emergency operation by pressing and holding the O button.

Automatic return (AR mode)

If you press the button briefly, the door starts moving in the opening direction until the door reaches the OPEN door end position, or until the door is stopped by actuating the button. The configured open time starts when the door is in the door end position "OPEN". After the open time has elapsed, a configured warning time starts. After this time has elapsed, the door starts to move in the closing direction automatically. If a radio start command is given during closing, the door reverses back to the door end position OPEN. If the door is reversed 5 times in succession during closing by force monitoring, the closing edge safety device or photoelectric sensor, the AR mode is cancelled in the door end position OPEN. The AR mode is restarted with a new start command.

Prioritised input (optional) – emergency operation

The "Prioritised input" function is provided via an optionally available plug-in module and offers the possibility of moving the door to a previously configured door position by means of an external control. The safety functions of the DCC remain active in this case. This means that after a safety function has been triggered and then returned to a safe state, the DCC will again attempt to move to the predefined position. If the input signal is withdrawn during operation, the drive stops and the DCC is set back to normal operation. If the set position is reached, returning to normal operation is only possible by disconnecting the power supply of the DCC.

Mutual locking (optional)

The optionally available plug-in module enables coupling with another control unit (e.g. dock leveller control) for the purpose of mutual interlocking. The "Lock" input J31 of the plug-in module can be used to lock the closing command of the drive. The drive is locked if the contact of terminal J31 is open. The door can be closed if the contact is closed.

Lighting and / or an advance warning light (optional)

The DCC is equipped with a status relay with which external lighting or an advance warning light can be switched.

External control devices

The door can be operated by external control devices / pulse generators. The operation corresponds to the section "Pulse OPEN / Pulse CLOSE" and "Automatic return (AR mode)". If a single start button is used as control device, value 2 must be set in menu item 51. This allows for operation in the OPEN-STOP-CLOSE-STOP pulse sequence.

Radio hand-held transmitter (optional)

With the radio hand-held transmitter, the door can be operated in pulse OPEN/pulse CLOSE and in AR mode. In pulse mode, the radio hand-held transmitter is provided with the pulse sequence OPEN-STOP-CLOSE-STOP-... . In AR mode, a radio command from the CLOSE position or during closing causes the door to open. A radio command during the open time or the warning time restarts the open time.

Radio hand-held transmitter 1/2 door opening (optional)

If a radio hand-held transmitter has been programmed for this function in menu item 61, the following function is available: Briefly press the button for the 1/2 door opening on the hand-held transmitter to move the door to the pre-configured position. If no position for the 1/2 door opening has been programmed in menu item 32, half the travel path is automatically used.

Emergency operation

Risk of being crushed or hit by the moving door in emergency operation

Persons can be struck when the door is closed or collide with the door.

- For emergency operation the door needs to be checked and found to be in perfect mechanical condition.
- During emergency operation, a clear view to the door from the place of operation must be ensured.
- Ensure that no other persons are in the danger zone of the door.

The emergency operation permits the operation of the door with defective or tripped safety devices. The emergency operation is activated by pressing and holding the ^(C) button for 5 seconds.

Emergency operation with emergency crank handle

This function applies to the DCC-80 NHK and NHK-WE variants.

Fig. Pull off the cover for the crank receptacle and fold it to the side.

Fig. D Insert the crank handle into the receptacle as far as it will go. If necessary, slowly turn the crank and try to insert it further with light pressure until it engages in the drive.

Fig. C Then turn the crank to the desired direction to open or close the door.

Emergency operation with quick chain

This function applies to the DCC-80 SK and SK-WE variants.

Fig. **d** Pull the red handle on the emergency release to switch off the drive electronically. Open or close the door by using the chain.

Fig. • To operate the door with the drive again, pull the green handle.

Emergency operation with mechanical emergency release

This function applies to the DCC-80 ER variant.

Fig. I Pull the red handle of the emergency release. The drive is mechanically separated from the door. Open or close the door by hand.

Fig. 9 To operate the door with the drive again, pull the green handle. The drive is reconnected to the door mechanically.

1 x	1 x	Emergency operation
	2 x	Slack rope switch triggered (J3/RSE/ IPD-S)
	3 x	Wicket door open / fault (J3/RSE/ IPD-S) Short circuit coiled cable (J3/RSE/ IPD-S)
	4 x	Roll-up protection menchanism triggered (J4)
	5 x	Drive disengaged
	6 x	Emergency limit switch OPEN approached
2 x	1 x	Closing edge safety device (J3/RSE) triggered Testing for pressure wave switch failed
	2 x	Photoelectric sensor (J3 / IPD-S) triggered
	3 x	Runtime reached
	4 x	-
	5 x	Power supply error
	6 x	-
3 x	1 x	Runtime limitation almost reached
	2 x	RSE module error
	3 x	RSE RadioDutyCycle/battery
	4 x	DES error / rotation direction
	5 x	Testing has failed
	6 x	_
4 x	1 x	Interlock input LOCK (J31) is active on option module
	2 x	Current overload / obstruction
	3 x	EDL100 fault
	4 x	-
	5 x	-
	6 x	_

Example:

blue – red – red – red	Wicket door open,	
	short circuit coiled cable	

Error	State	Diagnosis / remedy
DCC ev	ents	
E01	No door movement	Roll-up protection mechanism no. 1 activated
E02	No door movement	Roll-up protection mechanism no. 2 activated
E03	No door movement	Wicket door open
E04	No door movement	Control unit interlocked by external control Set bridge at terminal LOCK to option module
E05	No door movement	Slack rope switch has triggered
E06	Door reverses	Closing edge safety device has tripped
E07	Door reverses	Photoelectric sensor has triggered
E08	No door movement	Drive has been disengaged
E13	Door reverses	Overcurrent detected
E20	Display when fully operational	Runtime limitation almost reached
E30	Door only closes in dead man mode	Emergency operation. Check closing edge safety device or photoelectric sensor
RSE eve	ents	
E43	No door movement	RSE wicket door open
E45	No door movement	RSE slack rope switch has triggered
E46	Door reverses	RSE closing edge safety device triggered
IPD-S ev	vents	
E53	No door movement	IPD-S bracket wicket door open
E55	No door movement	IPD-S slack rope switch has triggered
DCC err	or	
F11	No door movement	Error during testing of the current measuring device
F12	No door movement	Current overload detected
F13	No door movement	Temperature sensor has triggered, allow drive to cool down
F15	No door movement	Testing of photoelectric sensor has failed
F17	No door movement	ENS6800 sensor error detected (J3)
F18	No door movement	Short circuit detected in coiled cable line (J3)
F21	Brief operational interruption	Runtime limitation of door drive, let drive cool down for approx. 20 min
F22	No door movement	EDL100 not recognised Check wiring
F23	No door movement	Error during locking/unlocking procedure EDL100
F24	No door movement	Communication error with DES
F27	No door movement	Drive blockage detected
F28	No door movement	Faulty voltage supply.

Error	State	Diagnosis / remedy
F29	No door movement	Wrong rotation direction detected
F31	No door movement	Emergency limit switch OPEN approached Retract the door in a de-energised state using the emergency manual override.
F32	No door movement	Runtime limitation activated, door run longer than 90 seconds
RSE err	or	
F40	No door movement	RSE module not recognised
F41	No door movement	RSE receiver and transmitter are not paired
F42	No door movement	RSE radio interference detected
F44	No door movement	RSE battery empty
F47	No door movement	RSE error ENS6800 sensors
F48	No door movement	RSE short circuit detected
F49	No door movement	RSE radio duty cycle exceeded
IPD-S er	ror	
F57	No door movement	IPD-S wicket door error
F58	No door movement	IPD-S short circuit detected in coiled cable line
Test err	or	
F90- F99 F9A	No door movement	Internal testing failed. Switch drive off and on again.
General	indication	
CS	_	Maintenance cycles reached Perform service activity
IA	-	Control unit inactive Prioritised position was approached Return to normal operation by mains reset
Lo	_	Operation of the drive has been locked
dE	_	Determining the limit switch type is active

10 **Maintenance**

Tasks to be performed before starting 10.1 maintenance

NOTICE

NOTICE

For your safety, we recommend that the door system be checked before initial use and as needed - at least once a year - in accordance with the check list in the **Inspection** chapter. The check can be carried out by a person with the corresponding qualification certificate or by a specialist company.

First carry out the following steps before performing maintenance activities on the door:

- 1. Disconnect from the mains.
- 2. Secure against inadvertent switch-on.
- 3. Verify de-energised state.
- Please note that works on the electrical system only be per-4 formed by skilled electricians or instructed persons working under the direction and supervision of a skilled electrician in accordance with the electrotechnical rules and directives may.

10.2 Maintenance unlocking function

The variants with the quick chain and emergency crank handle are equipped with an optional maintenance unlocking function which mechanically disconnects the drive from the door and allows the door to be checked for ease of motion.

This function may only be operated when the drive is at a standstill. The drive must also be disconnected from the power supply.

1. Loosen the screw and remove the cover (1).

- Turn the red lever (2) in clockwise direction while discon-2. necting the drive from the door.
 - ⇔ The door can now be moved by hand and the door movement can be checked.

11 Disassembly

Disassembly is carried out in reverse order of the assembly instructions in the Installation chapter.

12 Disposal

Dispose of packaging material in an environmentally friendly way and in accordance with the applicable local disposal regulations.

The symbol with the crossed-out waste bin on waste electrical or electronic equipment stipulates that this equipment must not be disposed of with the household waste at the end of its life. The separate collection of waste electrical and electronic equipment aims to enable the re-use, recycling and other forms of recovery of waste equipment as well as to prevent negative effects for the environment and human health caused by the disposal of hazardous substances potentially contained in the equipment. Dispose of the waste electrical or electronic equipment in accordance with national legislation.

UK (The following applies for the United Kingdom)

According to Waste Electrical and Electronic Equipment Regulations 2013 (SI 2013/3113) (as amended) devices that are no longer usable must be collected separately and disposed of in an environmentally friendly manner.

13 Declaration of conformity and incorporation

Declaration of Incorporation in accordance with the EC Machinery Directive 2006/42/EC

Manufacturer's declaration of incorporation (translation of the original)

For the installation of partly completed machinery in terms of the EC Machinery Directive 2006/42/EC, Annex II Part 1 Section B. We hereby declare that the following partly completed machinery - as far as possible with respect to the scope of supply complies with the essential requirements of the EC Machinery Directive. The partly completed machinery is only intended to be incorporated into a door system to thus form a complete machine within the meaning of the EC Machinery Directive. The door system must not be put into service until the final machinery has been declared in conformity with the provisions of the EC Machinery Directive and the EC Declaration of Conformity according to Annex II Part 1 Section A is available. We furthermore declare that the relevant technical documentation for this partly completed machinery has been compiled in accordance with Annex VII, Part B, and undertake to transmit it through our Documentation Department in response to a reasoned request by the competent national authorities.

Product model / product:	DCC-80
Product type:	Door drive
Year of manufacture from:	08/2023
Product type: Year of manufacture from:	Door drive 08/2023

Relevant EU directives:

- 2014/30/EU
- 2011/65/EU RoHS Directive including Annex II according to (EU) 2015/863

Fulfilled requirements of the EC Machinery Directive 2006/42/ EC, Annex I, Part 1:

 1.1.2, 1.1.3, 1.1.5, 1.2.1, 1.2.2, 1.2.3, 1.2.4, 1.2.5, 1.2.6, 1.3.2, 1.3.4, 1.5.1, 1.5.2, 1.5.4, 1.5.5, 1.5.6, 1.6.1, 1.6.2, 1.6.3, 1.7

Applied harmonised standards:

- EN ISO 12100:2010
- EN ISO 13849-1:2015
- EN 60335-1:2012
- EN 60335-1:2012/AC:2014
- EN 60335-1:2012/A11:2014
- EN 60335-1:2012/A13:2017
- EN 60335-1:2012/A15:2021
- EN 60335-2-103:2015
- EN 61000-6-2:2005
- EN 61000-6-2:2005/AC:2005
- EN 61000-6-3:2007
- EN 61000-6-3:2007/A1:2011/AC:2012
- EN 61000-6-3:2007/A1:2011
- EN 300 220-2 V3.1.1

Other applied technical standards and specifications:

- EN 12453:2022
- EN 12604:2021
- EN 300220-1:2017
- EN 301489-1:2020

Manufacturer and name of the authorised representative of the technical documentation:

Novoferm tormatic GmbH Eisenhüttenweg 6 44145 Dortmund

Place and date of issue:

Dortmund, 22.08.2023

Dr. René Schmitz, Managing Director

Declaration of Conformity according to Directive 2014/53/EU

The integrated radio system complies with directive 2014/53/EU. The full text of the declaration of conformity can be found at: https://www.tormatic.de/dokumentation/

14 Inspection

When being commissioned, power-operated doors must be inspected and maintained by correspondingly qualified persons (persons with suitable qualifications, based on knowledge and experience) and in compliance with intervals specified by the manufacturer in the maintenance instructions and, if necessary, also in accordance with any special national regulations (e.g. ASR A1.7 "Technical Rules for Workplace Safety - doors and gates"). All maintenance and inspection tasks must be documented in the inspection logbook provided. It must be kept safe by the operating company, together with the documentation of the door system, throughout the entire service life and must be handed over to the operating company in a duly completed fashion, at the latest on the date of commissioning by the technician (we also recommend this for manually operated doors). The specifications laid down in the documentation of the door system (assembly, operating and maintenance instructions, etc.) must be absolutely observed in any case.

The manufacturer's warranty expires immediately if the inspection / maintenance has not been carried out properly!

Any changes that are made to the door system (if permitted at all) must also be documented.
